

ADVANCE REMOTE SENSING LAB

Previously we have worked on **Erdas model builder basic** exercises**,** in today's session we will try to create **indices**

- NDVI

Data Set: you can use your own project data set or data available on lms

Software: Erdas Imagine

"Unless a student is acquainted with three principles, he does not benefit from his knowledge thou he read millions of books"

1- *Do not love or prefer temporary life of this world over world hereafter*
2- *Be not friend of Satan, for he is not friend of Muslim*
3- *Never harm/ tease any one, for thou, this is not a trait of a Muslim*

Sheikh Shaqiq al-balkhi (rh)

- **Search formulae for NDVI**
  Write formulae here

- **Create a model for NDVI as you created models before, you just have to change function**
  Band x – band y/ Band x + band y where x and y will be NDVI bands
  Paste picture of your model here
  Equation of your function here

- **Once you created a model use inquire cursor to detect maximum and minimum values for water pixel**
  Maximum Value
  Minimum Value

- **Start Arc Map, search for reclassify tool make different classes for your data, e.g. if I have**
  Minimum value = -1
  Maximum value = 0.4
  I will make three classes,
  - less than 0
  - Between 0 & 0.4
  - 0.4 (greater than 0.4)

  Snapshot of your classes table here

- **Search for Extract by attributes tool in ArcMap to extract your desired class**
- For extracting healthy vegetation
  extract –value classQuery and output
  here

- **Make a map for vegetation covered output**
  Use base map or satellite imagery to make a good looking map
